

Precise predictions for Higgs production in association with top quarks

Ansgar Denner, Würzburg

Radcor 2015 and Loopfest XIV, UCLA, June 15–19, 2015

in collaboration with Robert Feger

partially published in JHEP 1504 (2015) 008 [arXiv:1412.5290]

- Introduction
- Irreducible background and interference effects
- NLO QCD corrections to $pp \rightarrow W^+W^-b\bar{b}H$
- Conclusions

Higgs boson observed \Rightarrow investigate its properties \Rightarrow measure its couplings
 important process: associated Higgs production with top-antitop quarks:

- allows direct measurement of top Yukawa coupling ($Ht\bar{t}$ coupling)
- small cross section: $\sigma \approx 500 \text{ fb}$ at 13 TeV
- large background from $t\bar{t}b\bar{b}$, $t\bar{t}jj$ renders analysis extremely difficult
- need improved experimental analyses (highly boosted Higgs bosons) and precise theoretical predictions for signal and background
- results from LHC run I:

CMS '15: $\mu = 1.2 + 1.6 - 1.5$ for $\sigma(t\bar{t}H)$, $H \rightarrow b\bar{b}$

ATLAS '15: $\mu = 1.5 \pm 1.1$ for $\sigma(t\bar{t}H)$, $H \rightarrow b\bar{b}$

Production processes

- $pp \rightarrow W^+ W^- b \bar{b} H \rightarrow l \nu_l j j b \bar{b} H$
- $pp \rightarrow W^+ W^- b \bar{b} H \rightarrow l \nu_l l' \nu_{l'} b \bar{b} H$

decay processes

$$H \rightarrow b \bar{b}, \tau^+ \tau^-, ZZ, WW$$

$$pp \rightarrow l \nu_l j j b \bar{b} b \bar{b}$$

- complicated final state
- experimentally and theoretically challenging

this talk:

- study of irreducible background and interference effects for $pp \rightarrow l \nu_l j j b \bar{b} b \bar{b}$
- results for NLO QCD corrections for $pp \rightarrow e^+ \nu_e \mu^- \bar{\nu}_\mu b \bar{b} H$

Irreducible background and interference effects

Three scenarios: scenario 1

- $t\bar{t}H$ production: $pp \rightarrow t\bar{t}H \rightarrow l^+ \nu_{lj} b\bar{b}b\bar{b}$
 - ▶ intermediate t, \bar{t}, H required
treated in **pole approximation**
 - ▶ **gluon–gluon** partonic channels $gg \rightarrow l^+ \nu_{lj} q' \bar{q}'' b\bar{b}b\bar{b}$
order of amplitude: $\mathcal{O}(\alpha_s \alpha^3)$
 - ▶ **quark–antiquark** partonic channels $q\bar{q} \rightarrow l^+ \nu_{lj} q' \bar{q}'' b\bar{b}b\bar{b}$
order of amplitude: $\mathcal{O}(\alpha_s \alpha^3), \mathcal{O}(\alpha^4)$
 - ▶ sample diagrams

Scenario 2

- $t\bar{t}b\bar{b}$ production $pp \rightarrow t\bar{t}b\bar{b} \rightarrow l^+ \nu_{lj} b\bar{b} b\bar{b}$
 - ▶ intermediate t, \bar{t} required, treated in **pole approximation**
no resonant Higgs required
 - ▶ same partonic channels as above
additional $\mathcal{O}(\alpha_s^2 \alpha^2)$ contributions for gg and $q\bar{q}'$ channels ($H \rightarrow g$)
(plus contributions with $H \rightarrow Z, \gamma, W$)
 - ▶ sample diagrams

Scenario 3

- full process $pp \rightarrow l^+ \nu_{lj} b \bar{b} b \bar{b}$
 - ▶ complete set of diagrams: no resonances required
 - ▶ # of channels increases by more than factor 4 owing to crossing symmetric channels
 - ▶ amplitude receives contributions of $\mathcal{O}(\alpha^4)$, $\mathcal{O}(\alpha_s \alpha^3)$, $\mathcal{O}(\alpha_s^2 \alpha^2)$ and $\mathcal{O}(\alpha_s^3 \alpha)$ up to 78052 diagrams for individual channels! (unitary gauge)
 - ▶ sample diagrams

- **complex-mass scheme** for unstable particles
Denner, Dittmaier, Roth, Wieders '99
- **on-shell projection** of momenta
for resonances treated in **pole approximation**
such that invariants of other resonances are not shifted!
- massless light quarks, **massive b quarks**
- only PDFs of light quarks included (u, d, c, s) besides gluons
- **all matrix elements calculated with RECOLA** (recursive algorithm)
Actis et al.
- phase-space integration: **multi-channel Monte Carlo**
⇒ number of diagrams matters

- collider energy: 13 TeV
- scale choice: Beenakker et al. '03
 $\mu = \mu_R = \mu_F = \frac{1}{2} (2m_t + m_H) = 236 \text{ GeV}$
- PDFs: CT10LO Lai et al. '10
- input parameters:

$$\begin{aligned}
 m_t &= 173 \text{ GeV}, & \Gamma_t &= 1.47 \text{ GeV}, & m_b &= 4.8 \text{ GeV} \\
 M_H &= 126 \text{ GeV}, & M_Z^{\text{OS}} &= 91.1876 \text{ GeV}, & M_W^{\text{OS}} &= 80.385 \text{ GeV} \\
 \Gamma_H &= 4.21 \times 10^{-3} \text{ GeV}, & \Gamma_Z^{\text{OS}} &= 2.4952 \text{ GeV}, & \Gamma_W^{\text{OS}} &= 2.0850 \text{ GeV}
 \end{aligned}$$

- cuts:

$$\begin{aligned}
 p_{T,j} &> 25 \text{ GeV}, & |y_j| &< 2.5, & \Delta R_{jj} &> 0.4 \\
 p_{T,b} &> 25 \text{ GeV}, & |y_b| &< 2.5, & \Delta R_{bb} &> 0.4 & \quad \Delta R_{jb} &> 0.4 \\
 p_{T,l^+} &> 20 \text{ GeV}, & |y_{l^+}| &< 2.5, & p_{T,\text{miss}} &> 20 \text{ GeV}
 \end{aligned}$$

- b quarks originating from t and \bar{t} quark are selected according to

$$\mathcal{L} \propto \frac{1}{(p_{l^+ \nu_l b_i}^2 - m_t^2)^2 + (m_t \Gamma_t)^2} \frac{1}{(p_{l_1 l_2 b_j}^2 - m_t^2)^2 + (m_t \Gamma_t)^2}$$

$pp \rightarrow t\bar{t}H \rightarrow l^+ \nu_l j j b \bar{b} b \bar{b}$ (at leading order)

| | cross section [fb] | | | |
|------------|-----------------------------|--------------------------------------|-----------|--------------|
| | $\mathcal{O}((\alpha^4)^2)$ | $\mathcal{O}((\alpha_s \alpha^3)^2)$ | total | fraction [%] |
| $q\bar{q}$ | 0.014887(2) | 2.1467(2) | 2.1621(2) | 29 |
| gg | – | 5.230(1) | 5.2298(9) | 71 |
| Σ | 0.014887(2) | 7.377(1) | 7.3920(9) | 100 |

- 70% from gg processes
- $\mathcal{O}((\alpha_s \alpha^3)^2)$ dominates
- pure EW contribution $\mathcal{O}((\alpha^4)^2)$ tiny
- no interferences between different orders
owing to colour matrices

$pp \rightarrow t\bar{t}b\bar{b} \rightarrow l^+ \nu_{lj} b\bar{b} b\bar{b}$ (at leading order)

| | cross section [fb] | | | sum | total | fraction [%] |
|------------|-----------------------------|--------------------------------------|--|-----------|-----------|--------------|
| | $\mathcal{O}((\alpha^4)^2)$ | $\mathcal{O}((\alpha_s \alpha^3)^2)$ | $\mathcal{O}((\alpha_s^2 \alpha^2)^2)$ | | | |
| $q\bar{q}$ | 0.018134(6) | 2.4932(9) | 0.9199(2) | 3.4312(9) | 3.4366(6) | 13 |
| gg | – | 7.818(4) | 16.650(9) | 24.47(1) | 23.010(7) | 87 |
| Σ | 0.018134(6) | 10.311(4) | 17.570(9) | 27.90(1) | 26.446(7) | 100 |

- Irred. background from $t\bar{t}b\bar{b}$: $\sigma_{t\bar{t}b\bar{b}}^{\text{Irred.}} = 19.06 \text{ fb} = (26.45 - 7.39) \text{ fb}$ (260%)

mainly from QCD production (Higgs replaced by gluon)

additional background from Z bosons ($t\bar{t}Z$: 1.01 fb), W bosons and photons

- Negative interferences between different orders:

$< 0.2\%$ in $q\bar{q}$, 6% in gg , 5% for $\sigma_{t\bar{t}b\bar{b}}$

main source:

interferences of dominant QCD diagrams with t -channel W-exchange diagrams

signal–background interference $< 1\%$

$pp \rightarrow l^+ \nu_{lj} b \bar{b} b \bar{b}$ (at leading order)

| cross section [fb] | | | | | | | |
|--------------------|-----------------------------|--------------------------------------|--|--------------------------------------|-----------|-----------|--------------|
| | $\mathcal{O}((\alpha^4)^2)$ | $\mathcal{O}((\alpha_s \alpha^3)^2)$ | $\mathcal{O}((\alpha_s^2 \alpha^2)^2)$ | $\mathcal{O}((\alpha_s^3 \alpha)^2)$ | sum | total | fraction [%] |
| gq | – | 0.231(4) | 0.370(2) | 0.365(1) | 0.966 (4) | 0.944 (9) | 3.3 |
| $g\bar{q}$ | – | 0.0421(6) | 0.0679(3) | 0.0608(2) | 0.1708(7) | 0.167 (1) | 0.6 |
| $qq^{(\prime)}$ | 0.001471(2) | 0.0575(5) | 0.1106(2) | 0.07871(9) | 0.2483(6) | 0.2478(8) | 0.9 |
| $q\bar{q}$ | 0.01973(3) | 2.531(6) | 0.957(1) | 0.00333(1) | 3.511 (6) | 3.538 (4) | 12.4 |
| gg | – | 8.01(2) | 17.19(6) | 0.00756(2) | 25.21 (6) | 23.71 (6) | 82.9 |
| Σ | 0.02120(3) | 10.87(2) | 18.69(6) | 0.516(2) | 30.10 (6) | 28.60 (6) | 100 |

- 83% from gg processes
- additional partonic channels ($gq, g\bar{q}, qq^{(\prime)}$) contribute 5%
- increase by only 8% relative to $pp \rightarrow t\bar{t}b\bar{b} \rightarrow l^+ \nu_{lj} b \bar{b} b \bar{b}$ ($26.45 \rightarrow 28.60$ fb)
- $\mathcal{O}((\alpha_s^3 \alpha)^2) < 2\%$
- interference pattern as for $pp \rightarrow t\bar{t}b\bar{b} \rightarrow l^+ \nu_{lj} b \bar{b} b \bar{b}$

- **invariant mass of b-jet pair with smallest ΔR distance:**
Higgs peak only weakly enhanced over combinatorial effect
 $t\bar{t}H/\text{full} \sim 0.25$ (as for integrated cross section) outside resonances
- **invariant mass of b-jet pair not resulting from top quarks:**
 $t\bar{t}H/\text{full}$ suppressed outside Higgs resonance (few per cent)
Higgs resonance and Z resonance well tagged

- azimuthal angle between b-jet pair not resulting from top quarks:
 - background peaked at small angles ($b\bar{b}$ pair dominantly from gluons)
 - signal prefers larger angles (massive Higgs boson)
- sum of all transverse energies H_T :
 - signal suppressed for small H_T ($t\bar{t}H$ threshold)
 - signal drops faster for large H_T (intermediate massive particles)
 - behaviour typical for transverse-momentum distributions

Constant shift of -5% for most contributions with some exceptions

- invariant mass of $b\bar{b}$ pair not resulting from top quark:
interference varies between 0% (on Higgs resonance) and -10%
- azimuthal angle between $b\bar{b}$ pair not resulting from top quark:
large interference for large angles (suppressed cross section)

NLO QCD corrections to

$$pp \rightarrow W^+W^-b\bar{b}H$$

Process: pp → e⁺ν_eμ⁻ $\bar{\nu}_\mu$ b \bar{b} H

stable Higgs boson, but full top decays ⇒

- misses substantial part of irreducible background to t \bar{t} H production
- includes all Higgs-production contributions
also Higgs radiation from W/Z bosons (radiation from b quarks neglected)

partonic subprocesses

- gg → e⁺ν_eμ⁻ $\bar{\nu}_\mu$ b \bar{b} H $\mathcal{O}(\alpha_s\alpha^{5/2})$
- q \bar{q} → e⁺ν_eμ⁻ $\bar{\nu}_\mu$ b \bar{b} H $\mathcal{O}(\alpha_s\alpha^{5/2})$
[$\mathcal{O}(\alpha^{7/2}) \sim 0.2\%$ of $\mathcal{O}(\alpha_s\alpha^{5/2})$ at LO ⇒ neglected]

sample diagrams

Results for signal process $pp \rightarrow t\bar{t}H$ (on-shell final-state particles)

- NLO QCD corrections ($\sim 20-30\%$) [Beenakker et al. '01, '02](#), [Dawson et al. '01-'03](#)
residual NLO scale uncertainty $\sim 10\%$
- NLO parton-shower matching [Frederix et al. '11](#); [Garzelli et al. '11](#)
- NLO EW corrections [Frixione et al. '14, '15](#) (stable top/Higgs); [Zhang et al '14](#) (NWA)

results for dominant background process $pp \rightarrow t\bar{t}b\bar{b}$

- NLO QCD corrections [Bredenstein et al. '08-'10](#); [Bevilacqua et al. '09](#)
- NLO parton-shower matching [Kardos, Trócsányi '13](#)
- NLO QCD corrections for massive bottom quarks and parton-shower matching [Cascioli et al. '13](#)

results for reducible background $t\bar{t}jj$ (misidentified bottom quarks)

- NLO QCD corrections [Bevilacqua et al. '10](#)
- NLO parton-shower matching [Höche et al. '14](#)

Calculation follows in many respects the one for pp → W⁺W⁻b \bar{b}

Denner, Dittmaier, Kallweit, Pozzorini '11, '12

- **complex-mass scheme** for t, Z, W Denner, Dittmaier, Roth, Wieders '99
- **Catani–Seymour dipole subtraction** for real corrections Catani, Seymour '97
(same dipoles as for pp → W⁺W⁻b \bar{b}) Dittmaier '99; Phaf, Weinzierl 01; Catani et al. '02

differences

- all matrix elements calculated with RECOLA
- appearance of heptagons (7-point functions)

include only $\mathcal{O}(\alpha_s)$ corrections to $\mathcal{O}(\alpha_s \alpha^{5/2})$ diagrams

partonic processes for real corrections

- $gg \rightarrow e^+ \nu_e \mu^- \bar{\nu}_\mu b \bar{b} H g$
- $q\bar{q} \rightarrow e^+ \nu_e \mu^- \bar{\nu}_\mu b \bar{b} H g$
- $g\{q/\bar{q}\} \rightarrow e^+ \nu_e \mu^- \bar{\nu}_\mu b \bar{b} H\{q/\bar{q}\}$

Setup for calculation

- (tree-level and one-loop) matrix elements with **RECOLA**
(Recursive computation of one-loop amplitudes) Actis, Denner, Hofer, Scharf, Uccirati
⇒ talk of Sandro Uccirati (today, parallel session III)
- tensor integrals with **COLLIER**
(Complex one-loop library in extended regularizations) Denner, Dittmaier, Hofer
⇒ talk of Lars Hofer (Tuesday, parallel session II)
- phase-space integration with in-house **multi-channel Monte Carlo** Feger

Checks

- LO and NLO matrix elements successfully compared with
MADGRAPH5_AMC@NLO Alwall et al. '14
- Ward identities checked for $gg \rightarrow W^+W^-b\bar{b}H$
- process without Higgs compared in detail against original calculation of
 $pp \rightarrow W^+W^-b\bar{b}$ Denner, Dittmaier, Kallweit, Pozzorini '11, '12
equivalent structure of real corrections and subtraction terms

Tuned comparison of virtual contributions between RECOLA and MADGRAPH5_AMC@NLO

Alwall et al. '14

$$\Delta = \frac{(\text{Re } \mathcal{M}_0^* \mathcal{M}_1)_{\text{MG}}}{(\text{Re } \mathcal{M}_0^* \mathcal{M}_1)_{\text{Recola}}} - 1$$

- typical agreement:
 $10^{-5} - 10^{-10}$ for gg
 $10^{-8} - 10^{-12}$ for $\bar{u}u$
- agreement worse than 10^{-3} for less than
0.3% of points for gg
0.05% of points for $\bar{u}u$

- convincing consistency check of MADGRAPH5_AMC@NLO and RECOLA
- successful check of 7-point functions in COLLIER
yield substantial contribution to virtual corrections

Numerical check of Ward identity for $gg \rightarrow e^+ \nu_e \mu^- \bar{\nu}_\mu H$

(polarization vector of gluon replaced by normalized momentum p^μ/p_0)

$$\Delta = \frac{\text{Re } \mathcal{M}_1(\epsilon \rightarrow p/p_0) \mathcal{M}_0^*}{\text{Re } \mathcal{M}_0^* \mathcal{M}_1}$$

- typical accuracy:
 $10^{-8} - 10^{-10}$
- agreement worse than
 10^{-3} for less than
0.04% of points

\Rightarrow

- WI check comparable or better than comparison with MADLOOP
- successful check of 7-point functions in COLLIER
(yield substantial contribution to virtual corrections)

Total cross section for $pp \rightarrow t\bar{t}H \rightarrow e^+ \nu_e \mu^- \bar{\nu}_\mu H$ (without cuts)

Set-up:

- tuned parameters
- loose cuts: $p_{T,b} > 2 \text{ GeV}$, $\Delta R_{bb} > 0.01$
(needed for IR safety of irreducible background: $g \rightarrow b\bar{b}$ or $b \parallel \text{beam}$)
- $\mathcal{O}(\alpha_s^2)$ matching correction according to [Denner, Dittmaier, Kallweit, Pozzorini '12](#)
(few per-cent effect)

agreement with literature at level of 1–2 per cent

- with [Beenakker et al. '02](#):
 - ▶ agreement at LO: within 1.6%
 - ▶ agreement at NLO: within 0.1%
- with [Frederix et al. '11](#):
 - ▶ agreement at LO: within 1.6%
 - ▶ agreement at NLO: within 0.6%

- pp collider energy: 13 TeV
- PDFs: **CT10 LO** and **CT10 NLO** Lai et al. '10
- scales:
 - fixed scale: $\mu_R = \mu_F = m_t + \frac{1}{2}M_H = 236 \text{ GeV}$ Beenakker et al. '03
 - dynamical scale: $\mu_R = \mu_F = (m_{t,T}m_{\bar{t},T}m_{H,T})^{1/3}$ with $m_T = \sqrt{m^2 + p_T^2}$ Frederix et al. '11
- top-quark width including off-shell W-boson effects ($t \rightarrow b l^+ \nu_l$)
from Jezabek, Kühn '89
- jet clustering: **anti- k_T algorithm** with $\Delta R = 0.4$ Cacciari, Salam, Soyez '08
- **cuts**: require two bottom jets and two charged leptons with

$$p_{T,b} > 25 \text{ GeV}, \quad |\eta_b| < 2.5$$

$$p_{T,l} > 20 \text{ GeV}, \quad |\eta_l| < 2.5$$

$$p_{T,\text{miss}} > 20 \text{ GeV}$$

$$\Delta R_{bb} > 0.4$$

| μ_0 | channel | σ_{LO} [fb] | σ_{NLO} [fb] | K |
|--------------------|---------------|--|--|------|
| μ_{dyn} | gg | 1.6001(1) ^{+33.8%} _{-23.6%} | 2.017(4) ^{-16.3%} _{+1.0%} | 1.26 |
| | $q\bar{q}$ | 0.67786(5) ^{+24.1%} _{-18.1%} | 0.492(1) ^{-39.6%} _{+17.2%} | 0.73 |
| | $gq/g\bar{q}$ | | 0.1341(4) ^{+297%} _{-152%} | |
| | pp | 2.2780(1) ^{+30.9%} _{-22.0%} | 2.643(4) ^{-4.7%} _{-3.7%} | 1.16 |
| μ_{fix} | gg | 1.5776(1) ^{+34.0%} _{-23.7%} | 1.997(4) ^{-16.5%} _{+1.0%} | 1.27 |
| | $q\bar{q}$ | 0.67498(5) ^{+24.3%} _{-18.2%} | 0.494(1) ^{-39.3%} _{+17.0%} | 0.73 |
| | $gq/g\bar{q}$ | | 0.1266(4) ^{+310%} _{-158%} | |
| | pp | 2.2526(1) ^{+31.1%} _{-22.1%} | 2.618(4) ^{-5.0%} _{-3.7%} | 1.16 |

- results for fixed and dynamical scale agree well
logarithmic average: $\bar{\mu}_{\text{dyn}} = 222.3 \text{ GeV} \approx 236 \text{ GeV} = \mu_{\text{fix}}$
- K factor for $pp \rightarrow t\bar{t}H$ recovered
[Beenakker et al. '03: $K \sim 1.2$, Frixione et al. '11: $K \sim 1.1$]
- reduction of scale dependence from 30% at LO to 5% at NLO

difference between fixed and dynamical scale 1%

Limit of on-shell top quarks

Extrapolate linearly

$$\bar{\sigma}(\Gamma_t) = \sigma(\Gamma_t) \left(\frac{\Gamma_t}{\Gamma_t^{\text{phys}}} \right)^2$$

to $\Gamma_t \rightarrow 0$

$\left(\frac{\Gamma_t}{\Gamma_t^{\text{phys}}} \right)^2$ corrects to
physical branching ratios

$$\bar{\sigma}(\Gamma_t \rightarrow 0) / \sigma(\Gamma_t^{\text{phys}}) - 1$$

$$= -0.08\% \text{ at LO}$$

$$= -0.33\% \text{ at NLO}$$

(of order $\Gamma_t/m_t \sim 0.8\%$
as expected)

fixed scale:

positron

hardest bottom quark

- steep drop of distributions
- K factor decreases strongly with p_T
(almost factor 2 between 25 and 400 GeV)

$$K_{LO} = d\sigma_{LO}(\mu)/d\sigma_{LO}(\mu_0)$$

$$K_{NLO} = d\sigma_{NLO}(\mu)/d\sigma_{LO}(\mu_0)$$

dynamical scale:

positron

hardest bottom quark

- K factor much flatter as function of p_T
variation between 25 and 400 GeV within 20% and LO uncertainty band
- residual scale uncertainty $\sim 10\%$

dynamical scale:

Higgs boson

bottom quark pair

- K factor for Higgs-boson p_T within LO uncertainty band
- K factor for b-quark pair p_T increases for high transverse momentum (high $p_{T,bb}$ region suppressed for on-shell top quarks, even larger effect for $t\bar{t}$ production)

dynamical scale:

azimuth between leptons

rapidity of Higgs boson

- NLO corrections shift events to small $\phi_{e+\mu^-}$, 40% effect
effect somewhat larger for fixed scale
- NLO corrections shift events to small Higgs-boson rapidity, 20% effect

Conclusions

Process $pp \rightarrow t\bar{t}H$ including top and Higgs decays investigated

- **Leading-order analysis of $pp \rightarrow l^+ \nu_l jj b\bar{b} b\bar{b}$**
 - ▶ irreducible background $\sim 2.6 \times$ signal at leading order
 - ▶ $pp \rightarrow t\bar{t}b\bar{b} \rightarrow l^+ \nu_l jj b\bar{b} b\bar{b}$ describes full process within 10%
 - ▶ sizeable interferences of -5% between QCD and EW diagrams flat for most but not all distributions
 - ▶ b-jet identification based on top-quark Breit–Wigners works well
- **NLO QCD corrections to $pp \rightarrow W^+W^- b\bar{b}H$ ($pp \rightarrow e^+ \nu_e \mu^- \bar{\nu}_\mu b\bar{b}H$)**
 - ▶ NLO corrections $\sim 17\%$ (10–40% for distributions)
 - ▶ scale dependence reduced to 5–10%
 - ▶ dynamical scale improves perturbative stability for large p_T
 - ▶ effects of top-quark decays on integrated cross section $< 1\%$
 - ▶ first calculation of $2 \rightarrow 5$ process with RECOLA and COLLIER
 - ▶ very good agreement of matrix elements with Madgraph5_aMC@NLO
